

WHAT IT IS

A web app that installs on your phone, tablet or computer like any other app. You fill in a geotechnical report section by section, on site or back at the office, and it builds the certifier-ready PDF: cover, contents, numbering, appendices, the lot. Everything saves as you type, with or without a signal.

INSTALL ONCE ON EACH DEVICE

iPhone / iPad (Safari)

1. Open the web address in Safari
2. Tap **Share** (the square with an arrow)
3. Tap **Add to Home Screen**, then **Add**

Android (Chrome)

1. Open the web address in Chrome
2. Tap the **:** menu, top right
3. Tap **Add to Home screen** or **Install app**

Windows / Mac (Chrome or Edge)

1. Open the web address in the browser
2. Click the install icon at the right end of the address bar
3. Click **Install**

abbot-design.github.io/geotech-report-engine

After installing, it opens from your home screen and works without internet. This manual is always one tap away under the **? Help** button in the app.

STARTING A REPORT

- **From Quickbase (usual way):** open the Geotech Report record and press **Send to Report Engine**. The engine opens with the client, site, author and reviewer already filled in. Check the address split into suburb, state and postcode; Quickbase keeps it as one line.
- **Pressing the button again later** is safe: it reopens the same report, and if anything has changed in Quickbase it shows you what differs and asks before overwriting.
- **By hand:** Home, then pick a type under **Start a new report**. You can change the type later; hidden sections keep their data.

FILLING IT IN

- Walk the sections with **Next**, or jump anywhere from the tabs. The rail shows which sections are started, complete, or still need something.
- Fields marked **Required to issue** block the final report until filled. Everything else is optional and simply left out of the document if blank.
- **Boreholes:** one row per 100 mm. Set the class and describe the material where it changes; PP (kPa) and DCP blows go on every row. The hole grows a metre at a time and ends where the log ends unless you type a depth. Full logs print in Appendix C; the body gets a summary.
- **DCP tests** beside a hole go on that hole; others get a card on the DCP tests tab. Type **R** after the last count at refusal.
- **Photos** go into the photo appendix with captions; one added on a borehole prints under its log. Use JPEG: on iPhone set Settings, Camera, Formats to **Most Compatible**.
- **PDF uploads** of lab results go into the results appendix, site-plan PDFs into the plans appendix. The first PDF needs internet once.
- **Information sheets** (CSIRO foundation maintenance and the like) are ticked on or off on the Review & issue page and land in Appendix D and the references together.
- Waiting on the lab? Tick **Results still pending** on the Results page. The report cannot be issued while it is ticked, so nothing goes out with the numbers missing.

THE WORKFLOW

- 1 **Draft** **DRAFT**: fill everything in. **Preview** shows the document at any time, with a DRAFT watermark across every page.
- 2 **Author:** on the **Review & issue** page, sign on screen and press **Submit for review**. **AWAITING REVIEW**
- 3 **Reviewer:** sign, or press **Request changes** to send it back as a draft.
- 4 **Issue:** from Preview, press **Issue final report**. The watermark comes off, the version and issue date are fixed. **ISSUED**
- 5 **Print:** Preview, then **Print / Save as PDF** and choose Save as PDF as the printer. **Page view** shows the exact A4 pages first if you want to check them.

Any edit after submitting returns the report to draft. Any edit after issuing reopens it as a new draft **version** (v2, v3 and so on), so an issued PDF can never quietly drift from the data behind it.

MOVING A REPORT BETWEEN DEVICES

- **Not started yet** (say, raised in the office, fieldwork on a tablet): open it and press **Send to another device** on the Review & issue page, then scan the QR code with the other device's camera.
- **Has photos or field data:** Home, the export arrow on the report, which saves a .json file named for the site. Email or AirDrop it, then on the other device use Home, **Transfer between devices**, **Import a report**.

THINGS TO BE AWARE OF

- Reports live only on the device they were made on; there is no cloud copy yet, so export anything important.
- On iPhone and iPad, always open it from the home-screen icon. Safari can clear a website's storage after a week without use; the installed app keeps it.
- Do not clear browsing history or site data for this app: that deletes its reports. Export first if you must.
- Deleting a report is instant, with **Undo** offered for a few seconds; after that it is gone.
